Page 1 - Landing/Home Page

Text-

Headline: Unlock the full potential of your city's mobility with Urban Web.
Subline: *A shared open infrastructure that connects a city's mobility services into a single layer.*

Visual-

Background: Video playing in loop. Video shows different aspects of an urban city's mobility all in one quick timelapse - trains, cycles, parking, walking, cars, taxis, buses etc.
CTA Button: "Explore the Network" takes the user to the next section - 'The Problem'
Animation: Headline fades in first, then subline and CTA together. Nothing bounces or slides — clean opacity/translate-up reveals.

The Challenge:

Text-

Headline: **Many journeys in a journey**
Cities are investing in mobility. New modes, new business models, new technologies with each one expanding what urban movement can be.
[Icons: shared mobility / ride-hailing / micro-mobility / last-mile delivery / electric / autonomous / urban aviation]
But every investment is building its own world. The traveller is left to connect them alone.
(Bold + Slightly bigger, should stand out a little bit)

Visual-

Diagram - siloed solutions which should show: The result of these siloed solutions is a platform-centric ecosystem, where value is locked within individual systems and coordination depends on slow, bilateral agreements. Innovation slows down, not because the city lacks capability, but because it lacks the conditions for systems to work together.
Animation - Each silo fades in one-by-one. Something to show that different siloes cannot connect to each other
Caption: The result is a city of silos. Value locked inside individual systems. Coordination dependent on whoever has the budget and the agreement. Every new connection starting from scratch.

Precedent:

Text-

Headline: This shift has happened before
Each one built the condition. Everything else followed.
[Each card: icon glyph + name + body]

1. Card 1: The web did not build websites, social media, or online commerce. It is the Infrastructure of Information.
2. Card 2: GPS did not build navigation or routing apps. It is the Infrastructure of Location.
3. Card 3: Mobile networks did not build services. It is the Infrastructure of Communication.

Closing line below cards: Urban Web brings that condition to cities. (Bold)

Visual-

Cards: Three horizontal cards. Minimal. name, one-liner. Cards fade in with scroll

What is Urban Web?

Text-

The web connected information. GPS connected position. Mobile networks connected devices.
Urban Web connects how a city moves. (Stand out)
It is a shared open infrastructure that any mobility service can connect to once, and through which it can immediately reach any other. Owned by no one. Open to everyone.
Cities that connect in this way don't just move people more efficiently. They create the conditions for culture, climate action, economic opportunity, and ideas that haven't yet been imagined to find each other through the same open layer.
Not a platform, not an intermediary, but the Infrastructure of Connections. (Stand out)

Visual-

Three horizontal layers, stacked vertically like geology:
Top layer — City Services. Icons or labels sitting on the surface: transit, shared mobility, ride-hailing, logistics, energy, micro-mobility. These are the things the city sees and uses. They rest on top of everything below.
Middle layer — Urban Web. Thin, clean, distinct in colour. Not thick or dominant — deliberately understated. This is the shared surface. A label: "The shared open infrastructure. Owned by no one."
Bottom layer — The NFH Fabric. The global decentralised infrastructure underneath. Subtle, technical, present but not foregrounded.

How it works?

Three full-width horizontal statements, stacked. Each one is a single sentence, set very large — 28 to 32px. Below each sentence, a small visual mechanism that shows exactly what that sentence means.

Statement 1 "Join once."

Visual: A single node (say, "City Bus Network") with one action — connecting to a thin ring. Animated: the node moves toward the ring and clicks in. Clean, satisfying, final.

Statement 2 "Reach everything."

Visual: The same node, now on the ring. Every other node on the ring — Ride hailing, shared mobility, urban aviation, e-buses, metros etc. — lights up simultaneously. Not one by one. All at once. That simultaneity is the point.

Statement 3 "Grow beyond mobility"

Visual: The ring expands outward. Commerce nodes, logistics nodes, energy nodes appear around it. The city's mobility layer is now a node in a larger network of networks. Label: "A network of networks."

Statement 4 "Nothing in the middle."

Visual: Two nodes connecting directly. A line between them. Urban Web visually steps back — fades to the periphery. The connection arrow goes node to node, not through anything. Small label on the line: "Direct. No intermediary."

What this makes possible

P1 (the obvious unlock): "When every mobility service in a city speaks the same standard, any two of them can work together without a bilateral agreement, a custom build, or a procurement cycle. A service that joins can immediately reach every other service that has joined. The network grows without anyone coordinating its growth. Every new participant makes it more useful for every participant already in it."

P2 (the deeper point): "But the more important aspect is what nobody planned. When everything sits on a shared open layer, the conditions exist for solutions that nobody has thought of yet. The value of open infrastructure is not just what you build on it today. It is what others build on it tomorrow, without asking permission and without depending on any single organisation to make it happen. And because the infrastructure is open and machine-readable, it is ready for the next generation of AI-native interfaces with agents that discover, transact, and coordinate across a city without being trapped inside any platform"

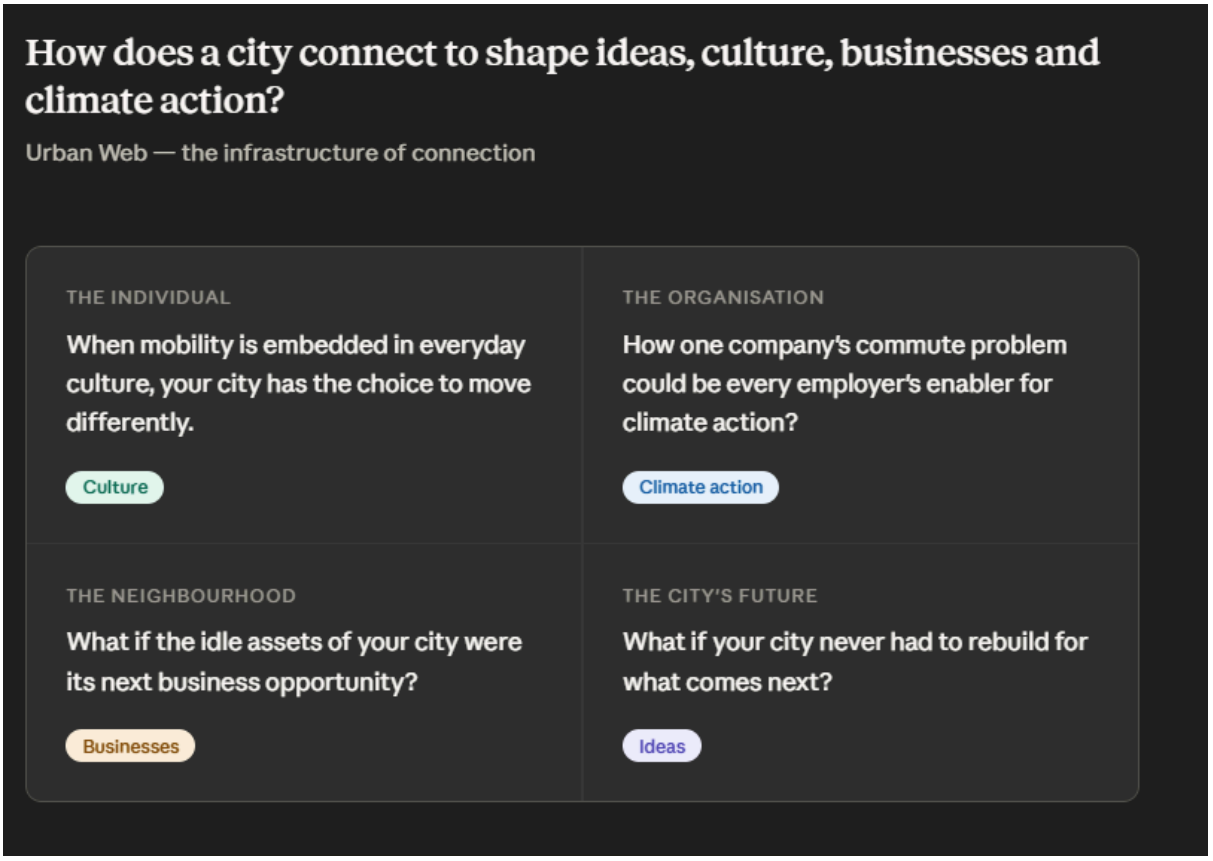
Visuals:
Behind the text: The mesh should be very low opacity — around 10 to 15 percent. Nodes as small dots, edges as thin lines, no labels. Slow, subtle animation — nodes gently pulsing, edges occasionally lighting up as if a transaction is passing through. It should feel alive but never demand attention. The moment a reader notices the mesh more than the text, the opacity is too high. The mesh does not need to represent any specific topology. It is not trying to explain anything. It is just the visual language of connection as a background condition.

The three headings in the above section, need to be in three tabs on the same page.

Below all three tabs, the callout box: "Urban Web is built on the NFH Fabric, a decentralised global infrastructure for open peer-to-peer value exchange. For a detailed technical overview, visit docs.beckn.io →"

Below the NFH Fabric call out, a button to go to the use cases page

Use Cases



Details of the use cases -

Imagine a concert app that sells tickets and already knows how you're getting there. A gym app that offers a bike-share credit with every membership. A hospital system that confirms your appointment and your ride in the same moment. Every platform in your city is able to offer every transit operator, ride-hailing service, and bike-share provider, as part of what they already do. Mobility as a feature of city life, not a separate decision. (Individual)

1. Cities set modal shift targets. Most of the lever sits in the daily commute — yet no city can see it clearly, measure it reliably, or act on it at scale. Imagine a company trying to prove its employees' sustainable commutes for its own ESG commitments. On Urban Web, solving that problem once makes the same capability available to every employer in the city. Every trip becomes verified proof. Every commute, a measurable contribution to your city's climate action. (Organisations)
   A. Unlocking Space (Parking):
   Cities have parking spaces — locked inside private platform inventories, or invisible to any digital system entirely. Drivers circle. Demand and supply exist in the same city but cannot find each other. What if every space — public, private, basement, residential — was visible, bookable, and connected to every transit option around it? Owners earn. Parking becomes a gateway into sustainable mobility. The city gains a mobility lever from assets it never had to build. (Neighbourhoods)
   B. Unlocking Capacity (idle fleet):
   Cities have vehicles locked to a single purpose — school runs, corporate commutes, guided tours. Outside that purpose, they are invisible to the city and its residents. What if every vehicle could be unbundled from its primary purpose — discoverable and responsive to any demand in the city? First and last mile gaps close without a single new vehicle. The city gains transit capacity from assets it never had to procure. (Neighbourhoods)
   A. Just Transition (Workforce)-
   Cities committing to electric fleets face a risk they cannot see — whether the workforce will be ready when the vehicles arrive. A driver's skills, certifications, and experience become invisible the moment they leave one employer for another. What if every driver's verified record travelled with them — visible to every operator, across every city? The transition the city committed to finds the workforce it needs. The people powering today's mobility have a place in tomorrow's. (City)
   B. Energy Transition -
   Every electric vehicle is a battery on wheels. Every office rooftop has solar. Every parked bus fleet is a grid asset waiting to be used. What if the infrastructure built for mobility was already the infrastructure for energy? The city extends. It doesn't rebuild. (City scale)

Structure of the use cases page: There will be 4 quadrants (like the image) indicating different scales which will have a small definition of what those scales are. These quadrants will be clickable. When they are clicked, use cases for those respective scales open up (not on a separate page, but as a pop up or something. Need to figure out the smoothest way) For all use cases, we want interactive clickable demos so the user can visually see and feel the impact of the the solutions.

Credibility section on NFH and WRI

NFH: Networks for Humanity (NFH) is a global non-profit initiative with a bold vision to provide open, interoperable and decentralized digital infrastructure that enables broader access and participation in the digital economy.

World Resources Institute: WRI is a global research organization working to improve people's lives, protect and restore nature and stabilize the climate by leveraging data, expertise and global reach to influence policy and catalyze change across systems like food, land and water; energy; and cities.

Call to Action - Interest Form

This should be a standard thing - something to email us, get on an email list or something.

*NOTE: The bar on the top should have buttons to go directly to any of the pages + the interest registering form as well
The credibility section and the call to action (interest form should be present at the bottom of all pages)
